Release Notes – V1.3

Changes since V1.2 (18 Sep 2026) • prepared 20 Oct 2026

In short
Admins can now **archive** unwanted entries and **download Excel** from every page. Every list has an **All** tab and searches across tabs, including **LR / DC numbers**. Motors and pumps are separated by type and can be received **one by one with their own specifications**. The regional warehouse lost Tested OK and Scrap and gained full OEM dispatch. Service engineers now see only whether their material was **received at the destination**, with the date. All times are now in **Indian Standard Time**.

Highlights by role

Role	What changed for them
Admin	Archive / restore entries (single, bulk, or everything before a date); Archived tab; filters by profile and by type; "Received at Warehouse" status; stage transfer dates; Download Excel; sidebar fixes; Reports & Analytics set to Coming soon.
Service Engineer	Sees only *Dispatched* or *Received at <destination>*, with the date received (in the expanded row and in Excel). No later stages are shown.
Regional Warehouse	Tested OK and Scrap removed. OEM dispatch added for received motors/pumps and P-serial cards. Per-item specifications when receiving motors/pumps.
Main Warehouse	Per-item specifications when receiving motors/pumps (mixed types allowed). Same OEM dialogs as the regional warehouse.
Service Desk	The date an item was transferred to Electronics is shown.
Electronics	New "Assigned to Electronics" column and both transfer dates in the expanded row.
Everyone	All tab, search across tabs (incl. LR / DC numbers), motor/pump type filter, pinned filters, Download Excel, IST times.

1. Admin dashboard

- **Archive (admin only).** Tick one or more rows and click *Archive selected*. Archived entries are removed from every other profile, from search, from reports and from Excel downloads. They stay in the database and appear only in the admin's **Archived** tab, where *Restore selected* brings them back. Nothing is deleted.
- **Archive by date.** Pick a date and click *Select* to tick every row in the current tab dated before it, review the selection, then archive. (The date range filter plus the header tick-box does the same.)
- **Works for not-yet-dispatched entries too.** A ticket line that was never dispatched can be archived; it also disappears from the engineer's dispatch list.
- **New status wording.** An item that a warehouse has received but not yet moved on now reads **Received at Warehouse** (previously it kept showing "Dispatched", so a Receive looked like it had not registered).
- **Filters.** The old "All engineers" filter is now **All profiles** and also lists every warehouse, service desk and electronics login. Selecting a login shows the items it acted on; a regional warehouse also shows everything sent to its location.
- **Transfer dates** (assigned to Service Desk / to Electronics) are shown in the expanded row.
- **Reports & Analytics is parked as "Coming soon".** The sidebar item is locked and the page shows only a placeholder – no data is shown to anyone until the analytics are properly built.
- **Sidebar fixes.** The collapsed sidebar no longer shows a cut-off version tag; its icons are centred and show a hover label; the full "Reports & Analytics" label now fits.

2. Service engineer view

An engineer needs to know one thing: did my material arrive? The page now answers only that.

- Status is either **Dispatched** (on its way) or **Received at <destination>** (for example “Received at Pune Warehouse”).
- Once received, the status stays the same however far the item travels afterwards – service desk, electronics, OEM, scrapped, repaired and added to stock are never shown to the engineer.
- **Received On** is shown in the expanded row. It is the date the place the engineer sent the item to received it – a later receive at another warehouse does not change it.
- The engineer’s Excel download contains only dispatch details (no later-stage columns).

3. Warehouses

- **Receive Motor / Pump, item by item.** Selecting several motors/pumps and clicking Receive now opens a list: one block per item with its own Capacity, OEM name, Head size and Inch size (a bare motor has no head/inch) and optional remarks. The receive date is shared. *Copy first item’s specs to the rest* saves time when items are identical. Different types can be received together. Every item is validated and saved separately; if any field is missing nothing is saved.
- **Regional warehouse – removed:** Tested OK (cards) and Scrap (motors/pumps), including the “Tested OK” tab. These are also refused by the server, not just hidden.
- **Regional warehouse – Dispatch to OEM** now uses the same dialogs as the main warehouse: motors/pumps ask for the inward and outward reservation numbers; P-serial cards ask for LR number, DC number and outward reservation number. Only received motors/pumps and P-serial cards can be sent to the OEM.
- Both warehouse pages share one set of dialogs, so they cannot drift apart.

4. Service Desk and Electronics

- The moment an item is transferred from Service Desk to Electronics is now shown: an **Assigned to Electronics** column on the Electronics page, and **Assigned to Service Desk / Assigned to Electronics** (date and time) in the expanded rows of both pages and the admin dashboard.

5. Lists, search and filters (all roles)

- **All tab** as the first tab on every list page. The usual working tab is still the default when a page opens.
- **Search across tabs.** While the search box has text, matches from every tab are shown, so nothing is hidden because it sits in another tab.
- **LR and DC (challan) numbers are searchable** – including the forwarding dispatch and the OEM dispatch numbers.
- **Motors and pumps separated by type:** the part-type filter now offers Submersible Motor, Submersible Pump, Surface Pump and Other Material, and each row’s label shows its type.
- **Pinned filters.** Search, filters and tabs stay at the top while scrolling (on phone-width screens they scroll normally).

6. Download Excel

A **Download Excel** button sits in the filter bar of every list page.

- It exports **exactly the rows currently shown** – current tab, search and filters all apply. Choose the **All** tab with no filters for the full list and filter by the Status column in Excel.
- 43 columns for internal roles (serials incl. corrections, status, dates, destination, received date, delivery partner, LR / DC, forwarding, motor/pump specs, OEM details, electronics diagnosis, reservation numbers, transfer dates, remarks, updated by / on). **Received On** sits directly after **Destination**.
- The server re-checks every exported row against what that role is allowed to see, so a user cannot export other people's data or archived entries.

7. Time zone

- The whole application now uses **Indian Standard Time (IST)** for display and for "today". Data is still stored in UTC, so existing records remain correct; times that were previously shown in UTC now read 5 h 30 min later. Excel downloads are converted to IST as well.
- This is part of the code – **no server or .env change is needed on EC2**. (Container log lines will still be stamped in UTC.)

8. Deployment notes

Item	Detail
Database	Three new migrations run automatically on start: **0017** (archive flag on items), **0018** (archived ticket lines), **0019** (destination received date, with a one-off back-fill for existing items). Additive only – no data is removed.
Configuration	No new environment variables. `.env` is unchanged.
Dependencies	None added (the Excel writer uses only the Python standard library).
Deploy	Pull the code, then `docker compose up -d --build`.
Git	V1.3 is one commit on top of V1.2. The local branch must be rebased onto `origin/main` before pushing.

9. Known limitations and follow-ups

- **Older forwarded items:** for items already forwarded *and* received again at the main warehouse before this release, the original destination's receive date was overwritten and cannot be recovered. The engineer sees the status but no date for those. New receives are recorded correctly.
- **Card receive** (Power / Control cards) still applies one serial-match answer, received serial number and reservation number to all selected cards. Motors/pumps are now per item; cards can be made per item the same way if needed.
- **Name matching:** any material whose name contains "motor" (for example "Motor Connector") is treated as a motor, and a regional warehouse login is linked to its location by name. Both are existing behaviour.
- **Testing:** changes were verified with automated end-to-end checks across every role, a simulated browser and a local test database with dummy data at every stage. A short acceptance check on the live pages (receive, archive, Excel, engineer view) is recommended after deployment.
